

OSHA Lockout For Automated Valves

OSHA Lockout For Automated Valves Prevents Maintenance Injuries

The Apollo® Lockout unit is designed to protect workers from accidental valve operation during service and maintenance. The OSHA 1910. 147-compliant device locks the valve in a fully open or closed position.

Apollo has designed the lockout with several important features:

- Six sizes available
- Top and bottom ISO 5211 mounting holes for easy installation between valve and actuator
- Investment cast stainless steel housing and base plate
- Stainless steel fastener, lock pin and coupling
- Acetal bushings buffer unit from actuator's torque and tension

Use with special attention on electric actuators to avoid motor burnout in the locked position.

The Apollo® Lockout provides OSHA-approved protection against accidental operation of automated valves. Made in the USA.
